Chapter 1

Introduction

1.1 Compatibility to Matlab’s™ Neural Network Toolbox

The compatibility is one of the strongest targets during developing this toolbox. If I have to develop an incompatibility e.g. in naming the functions, it will be described in this documentation. Even though it should be clear that I can’t make a one to one copy. First, the m-les are copyrighted and second, octave doesn’t yet support the object oriented-programming technology.

If you find a bug, any not described incompatibility or have some suggestions, please write me at michael.schmid@users.sourceforge.net. This will help improving this toolbox.

1.2 Version numbers

The first number describes the major release. Version number V1.0 will be the first toolbox release which should have the same functions like the Matlab R14 SP3 neural network Toolbox.

The second number defines the finished functions. So to start, only the MLPs will realised and so this will be the number V0.1.0.

The third number defines the status of the actual development and function. V0.1.0 means a first release with MLP. Actually it works only with Levenberg-Marquardt algorithm and Mean-Square-Error as performance function.

1.3 Known incompatibilities

1.3.1 Function names

\texttt{minmax}

\texttt{minmax} is in this toolbox called \texttt{min_max}. This is because Octave already has a function whichs name is \texttt{minmax}. This is a c file and the functions \texttt{min} and \texttt{max} are therein realized.
Chapter 2

Neural Network Package for Octave

This chapter describes all functions available in the neural network package of Octave. Even though it will be as compatible as possible to the one of MATLAB(TM).

2.1 Available Functions

2.1.1 min_max

$min\_max$ get the minimal and maximal values of an training input matrix. So the dimension of this matrix must be an RxN matrix where R is the number of input neurons and N depends on the number of training sets.

Syntax:

$mMinMaxElements = min\_max(RxN);$  

Description:

$RxN$: $R \times N$ matrix of min and max values for $R$ input elements with $N$ columns

Example:

\[
\begin{bmatrix}
1 & 11 \\
0 & 21 \\
\end{bmatrix} = min\_max
\begin{bmatrix}
3 & 1 & 3 & 5 & 11 \\
12 & 0 & 21 & 8 & 6 \\
\end{bmatrix}
\]

(2.1)

2.1.2 newff

$newff$ is the short form for new feed forward network. This command creates a feed-forward backpropagation network structure.

Syntax:

\[
net = newff(Rx2,[S1 S2 ... SN],[TF1 TF2 ... TFN],BTF,BLF,PF)
\]

Description:

$Rx2$: $R \times 2$ matrix of min and max values for $R$ input elements
$Si$: Size of $i$th layer, for $N$ layers
$TFi$: Transfer function of $i$th layer, default = "tansig"
$BTF$: Backpropagation network training function, default = "trainlm"
$BLF$: Backpropagation weight/bias learning function, NOT USED, is only for MATLAB(TM) compatibility
PF: Performance function, default = "mse"

Examples:

```matlab
net = newff(Rx2,[2 1])
net = newff(Rx2,[2 1],{"tansig","purelin"});
net = newff(Rx2,[2 1],{"tansig","purelin"},"trainlm");
net = newff(Rx2,[2 1],{"tansig","purelin"},"trainlm","notUsed","mse");
```

Comments:
In this version, you can have as much output neurons as you want. The same with the number of hidden layers. This means you can have one input layer, unrestricted number of hidden layers and one output layer. That’s it.

2.1.3 prestd
2.1.4 poststd
2.1.5 saveMLPStruct
This is an additional function which doesn’t exist in the neural network toolbox of MathWorks (TM). To see the network structure, you can use this command and save the complete structure to a file. Open this file and you have the same view like you would open the network type of MATLAB(TM).

Syntax:
```
saveMLPStruct(net,"initNetwork.txt");
```

2.1.6 sim

Syntax:
```
simout = sim(net,P);
```

Description:

Left-Hand-Side:
simout: Output values of the simulated network.

Right-Hand-Side:
net: Network, created and trained with newff(...) and train(...)
P: Input data

2.1.7 subset

`subset` can be used to optimize the data sets for train, test and validation of a neural network.

Syntax:
```
[mTrain, mTest, mVali] = subset(mData,nTargets,iOpti,fTest,fVali);
```
Description:

Left-Hand-Side:
mTrain: (R+T) x M matrix with R input rows, T output rows and M columns where M $\leq N$.
mTest: (R+T) x S matrix with R input rows, T output rows and S columns where S $\leq N$.
mVali: (R+T) x U matrix with R input rows, T output rows and U columns where U $\leq N$. And U can only exist, if S also exist.

Right-Hand-Side:

mData: (R+T) x N matrix with R input rows, T output rows and N columns

nTargets: Number of T output rows

iOpti: Integer value to define level of optimization.

fTest: Fraction to define the percentage of data sets which should be used for testing.

fVali: Fraction to define the percentage of data sets which should be used for testing.

iOpti can have following values:

0: no optimization

1: will randomise the column order and rearrange the columns containing min and max values to be in the train set

2: will NOT randomise the column order, but rearrange the columns containing min and max values to be in the train set

fTest or fVali have following meaning:

Each of this arguments can be a fraction or zero. The value 1 is not allowed! The sum of both values must also be smaller than 1!

Example: fTest = 1/3

Default values

iOpti = 1

fTest = 1/3

fVali = 1/6

Examples:

mTrain = subset(mData,2,1,0,0)

[mTrain,mTest] = subset(mData,2,1,1/3,0);

[mTrain,mTest,mVali] = subset(mData,1);

[mTrain,mTest,mVali] = subset(mData,1,1,1/3,1/6);

2.1.8 train

Syntax:

net = train(MLPnet,P,T,[],[],VV);

Description:

Left-Hand-Side:

net: Trained multi-layer network.

Right-Hand-Side:

MLPnet: Multi-layer network, created with newff(...)

P: Input data for training
T: Target data for training
]/: Not used right now, only for compatibility with Matlab
]/: Not used right now, only for compatibility with Matlab
VV: Validation data. Contains input and target values

Examples:

```matlab
net = train(MLPnet,P,T)
net = train(MLPnet,P,T,[],[],VV)
```

P,T must have the same number of rows as in newff(...).
VV.P, VV.T must have the same number of rows as in newff(...)

Comments:
Please be sure to put the validation values in a structure named VV.P and VV.T. VV can be changed, but not .P and .T!

2.1.9 trastd

2.2 Transfer functions

2.2.1 logsig

![Figure 2.1: Log-Sigmoid transfer function](image1)

\[ a = \text{logsig}(n) \]

![Figure 2.2: Log-Sigmoid transfer function logo](image2)

2.2.2 purelin

![Figure 2.3: Linear transfer function](image3)

\[ a = \text{purelin}(n) \]
2.2.3 tansig

I solved all of my real life problems with this transfer function if a non-linear function was used. In [4] page 2-6 the tansig is defined as in equation (2.2). A look on the MathWorks homepage with the keyword tansig will show that tansig is programmed as in equation (2.3).

\[
a = \frac{e^n - e^{-n}}{e^n + e^{-n}} \tag{2.2}
\]

\[
a = \frac{2}{(1 + e^{-2n}) - 1} \tag{2.3}
\]

Figure 2.5: Tansig transfer function

Figure 2.6: Tansig transfer function logo
Chapter 3

Examples

3.1 Example 1

You can find this example in the tests/MLP directory of each release or from the subversion repository. I will do (more or less) a line by line walkthrough, so after this should be everything clear. I assume that you have some experience with multilayer perceptrons.

3.1.1 Introduction

Our problem can be solved with a monotonically increasing or decreasing surface. An input vector $p$ (with 9 values) should be mapped onto one output value. Because we know that it can be solved with a monotonically increasing or decreasing surface, we can choose a 9-1-1 multi-layer perceptron (short: MLP). This means an MLP with 9 input neurons, only 1 hidden neuron and with 1 output neuron.

3.1.2 Code m-file

00019 ## Author: Michel D. Schmid
00020
00021
00022 ## load data
00023 mData = load("mData.txt","mData");
00024 mData = mData.mData;
```
00025 [nRows, nColumns] = size(mData);
00026 # this file contains 13 columns.
00027 # The first 12 columns are the inputs
00028 # the last column is the output,
00029 # remove column 4, 8 and 12!
00030 # 89 rows.
00031
00032 mOutput = mData(:,end);
00033 mInput = mData(:,1:end-1);
00034 mInput(:,[4 8 12]) = [];
00035 # delete column 4, 8 and 12
00036
00037 ## now prepare data
00038 mInput = mInput';
00039 mOutput = mOutput';
00040
00041 # now split the data matrix in 3 pieces, train data, test data and validate data
00042 # the proportion should be about 1/2 train, 1/3 test and 1/6 validate data
00043 # in this neural network we have 12 weights, for each weight at least 3 train sets.. 
00044 # (that's a rule of thumb like 1/2, 1/3 and 1/6)
00045 # 1/2 of 89 = 44.5; let's take 44 for training
00046 nTrainSets = floor(nRows/2);
00047 # now the rest of the sets are again 100%
00048 # = 2/3 for test sets and 1/3 for validate sets
00049 nTestSets = (nRows-nTrainSets)/3*2;
00050 nValiSets = nRows-nTrainSets-nTestSets;
00051
00052 mValiInput = mInput(:,1:nValiSets);
00053 mValiOutput = mOutput(:,1:nValiSets);
00054 mInput(:,1:nValiSets) = [];
00055 mOutput(:,1:nValiSets) = [];
00056 mTestInput = mInput(:,1:nTestSets);
00057 mTestOutput = mOutput(:,1:nTestSets);
00058 mInput(:,1:nTestSets) = [];
00059 mOutput(:,1:nTestSets) = [];
00060 mTrainInput = mInput(:,1:nTrainSets);
00061 mTrainOutput = mOutput(:,1:nTrainSets);
00062
00063 [mTrainInputN, cMeanInput, cStdInput] = prestd(mTrainInput);
00064 # standardize inputs
00065 ## comments: there is no reason to standardize the outputs because we have only
00066 # one output ...
00067
00068 # define the max and min inputs for each row
00069 mMinMaxElements = min_max(mTrainInputN);  # input matrix with (R x 2)...
00070
00071 ## define network
00072 nHiddenNeurons = 1;
00073 nOutputNeurons = 1;
00074
00075 MLPnet = newff(mMinMaxElements,[nHiddenNeurons nOutputNeurons],
00076 {'tansig','purelin'},'trainlm','','mse');
00077  # for test purpose, define weights by hand
00078 MLPnet.IW{1,1}(:) = 1.5;
00079 MLPnet.lW{2,1}(:,::) = 0.5;
00080 MLPnet.b{1,1}(:,::) = 1.5;
00081 MLPnet.b{2,1}(:,::) = 0.5;
00082
00083 saveMLPStruct(MLPnet,"MLP3test.txt");
00084
00085 ## define validation data new, for matlab compatibility
00086 VV.P = mValiInput;
00087 VV.T = mValliOutput;
00088
00089 ## standardize also the validate data
00090 VV.P = trastd(VV.P,cMeanInput,cStdInput);
00091
00092 [net] = train(MLPnet,mTrainInputN,mTrainOutput,[],[],VV);
00093
00094 # make preparations for net test and test MLPnet
00095 # standardize input & output test data
00096 [mTestInputN] = trastd(mTestInput,cMeanInput,cStdInput);
00097
00098 [simOut] = sim(net,mTestInputN);
00099 simOut

3.1.3 Walkthrough

Till line number 0023 there is really nothing interesting.
On line 0023 & 0024 data will be loaded. This data matrix contains 13 columns. Column 4, 8 and 12 won't be used (this is because the datas are of a real world problem). Column 13 contains the target values. So on the lines 0049 till 0051 this will be split into the corresponding pieces. A short repetition about the datas: Each line is a data set with 9 input values and one target value. On line 0038 and 0039 the datas are transposed. So we have now in each column one data set.

Now let’s split the data matrix again in 3 pieces. The biggest part is for training the network. The second part for testing the trained network to be sure it's still possible to generalize with the net. And the third part, and the smallest one, for validate during training. This splitting happens on the lines 0041 till 0061.

Line 0063 is the first special command from this toolbox. This command will be used to pre-standardize the input datas. Do it ever! Non linear transfer functions will squash the whole input range to an small second range e.g. the transfer function \texttt{tansig} will squash the datas between -1 and +1.

On line 0069 the next toolbox command will be used. This command \texttt{min_max} creates a $R \times 2$ matrix of the complete input matrix. Don’t ask me for what MATLAB(TM) this is using. I couldn’t figure out it. One part is the number of input neurons, but for this, the range would not be needed. Who cares ;-)?

Now it’s time to create a structure which holds the informations about the neural network. The command \texttt{newff} can do it for us. See the complete line and actually, please use it only on this way, each other try will fail! This means, you can change the number of input neurons, the number of hidden neurons and the number of output neurons of course. But don’t change the train algorithm or the performance function.

\texttt{saveMLPStruct} on line 0083 is a command which doesn’t exist in MATLAB(TM). This will save the structure with the same informations you can see in MATLAB(TM) if you try to open the net-type.

The validation part on line 0086 & 0087 is important. The naming convention is for MATLAB(TM) compatibility. For validate, you have to define a structure with the name \texttt{VV}. Inside this structure you
have to define actually \texttt{VV.P} \\& \texttt{VV.T} for validate inputs and validate targets. Bye the way, you have to pre-standardize them like the training input matrix. Use for this the command \texttt{trastd} like on line 0000.

\texttt{train} is the next toolbox command and of course one of the most important. Please also use this command like on line 0002. Nothing else will work.

The second last step is to standardize again datas. This time the test datas. See line 0006 for this and the last step. Simulate the network. This can be done with the command \texttt{sim}. This will be a critical part if someone else will write a toolbox with this command name!

I hope this short walkthrough will help for first steps. In next time, I will try to improve this documentation and of course, the toolbox commands. But time is really rare.

### 3.2 Example 2

You can find this example in this directory but renamed to \texttt{MLP9_1_1.m_template}. I will explain only differences to the example1, so please read it first, if you haven’t.

#### 3.2.1 Introduction

Our problem can be solved with a monotonically increasing or decreasing surface. An input vector \( p \) (with 9 values) should be mapped onto one output value. Because we know that it can be solved with a monotonically increasing or decreasing surface, we can choose a 9-1-1 multi-layer perceptron (short: MLP). This means an MLP with 9 input neurons, only 1 hidden neuron and with 1 output neuron.

#### 3.2.2 Code m-file

00019 ## Author: Michel D. Schmid
00020
00021
00022 ## load data
00023 mData = load("mData.txt","mData");
00024 mData = mData.mData;
00025 [nRows, nColumns] = size(mData);
00026  # this file contains 13 columns.
00027  # The first 12 columns are the inputs
```

11
# the last column is the output,
# remove column 4, 8 and 12!
# 89 rows.

\[ m\text{Output} = m\text{Data}(:,\text{end}); \]
\[ m\text{Input} = m\text{Data}(:,1:\text{end}-1); \]
\[ m\text{Input}(:,[4 \ 8 \ 12]) = []; \] # delete column 4, 8 and 12

\[ m\text{Data} = [m\text{Input} \ m\text{Output}]; \]

# now split the data matrix in 3 pieces, train data, test data and validate data
# the proportion should be about 1/2 train, 1/3 test and 1/6 validate data
# in this neural network we have 12 weights, for each weight at least 3 train sets..
# that's a rule of thumb like 1/2, 1/3 and 1/6
# 1/2 of 89 = 44.5; let's take 44 for training
\[ [m\text{Train},m\text{Test},m\text{Vali}] = \text{subset}(m\text{Data}',1); \]

\[ [m\text{TrainInputN},c\text{MeanInput},c\text{StdInput}] = \text{prestd}(m\text{Train}(1:\text{end}-1,:)); \] # standardize inputs

## comments: there is no reason to standardize the outputs because we have only
## one output ...

# define the max and min inputs for each row
\[ m\text{MinMaxElements} = \text{min\_max}(m\text{TrainInputN}); \] # input matrix with (R x 2)...

## define network
\[ n\text{HiddenNeurons} = 1; \]
\[ n\text{OutputNeurons} = 1; \]

\[ \text{MLPnet} = \text{newff}(m\text{MinMaxElements},[n\text{HiddenNeurons} n\text{OutputNeurons}],\]
\[ \{"tansig","purelin"},"trainlm","","mse"); \]

## for test purpose, define weights by hand
\[ \text{MLPnet.IW\{1,1\}(:)} = 1.5; \]
\[ \text{MLPnet.LW\{2,1\}(:)} = 0.5; \]
\[ \text{MLPnet.b\{1,1\}(:)} = 1.5; \]
\[ \text{MLPnet.b\{2,1\}(:)} = 0.5; \]

## define validation data new, for matlab compatibility
\[ \text{VW.P} = m\text{Vali}(1:\text{end}-1,:); \]
\[ \text{VW.T} = m\text{Vali}(\text{end},:); \]

## standardize also the validate data
\[ \text{VW.P} = \text{trastd}(\text{VW.P},c\text{MeanInput},c\text{StdInput}); \]

\[ [\text{net}] = \text{train}(\text{MLPnet},m\text{TrainInputN},m\text{Train}(\text{end},:),[],[],\text{VW}); \]

\[ \text{# make preparations for net test and test MLPnet} \]
\[ \text{# standardise input & output test data} \]
3.2.3 Walkthrough

The difference to the example 1 starts below the line number 0035. The difference concerns only the pre-processing section where the data set is split into the three subsets. This time, the command `subset` is used, which makes the complete example about 19 lines shorter! On line 0023 & 0024 data will be loaded. This data matrix contains 13 columns. Column 4, 8 and 12 won’t be used (this is because the data are of a real world problem). Column 13 contains the target values.

Now on line 35 we have to merge the input and output targets again. `Subset` will take the complete matrix as argument! On line 42 happens the complete magic :-). `Subset` will return three subsets containing each time the input and output arguments. So this part must be split once more! But this is very easy and happens at some specific positions below.

That’s it, `subset` will help you to write short scripts!
